# The Piscataqua River Currents with Sea Level Rise

## Tom Lippmann (Salme Cook & Anna Simpson)

University of New Hampshire

### - Numerical models (bathy, grids, b.c's)

COAWST- ROMS (also FVCOM)

30 m grid resolution

#### - <u>Simulate:</u>

Flows (3-dimensions)

Water levels (tides, subtidal) w/ & w/o SLR

#### - Verification

Field Observations (time series of Flows & water levels)

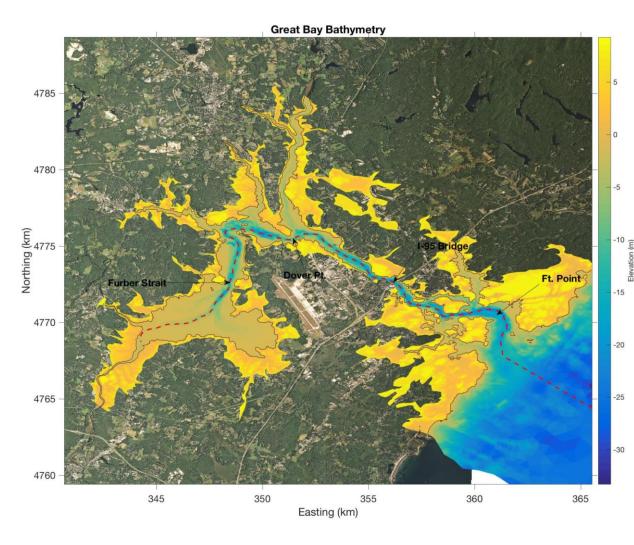

#### - <u>Results</u>

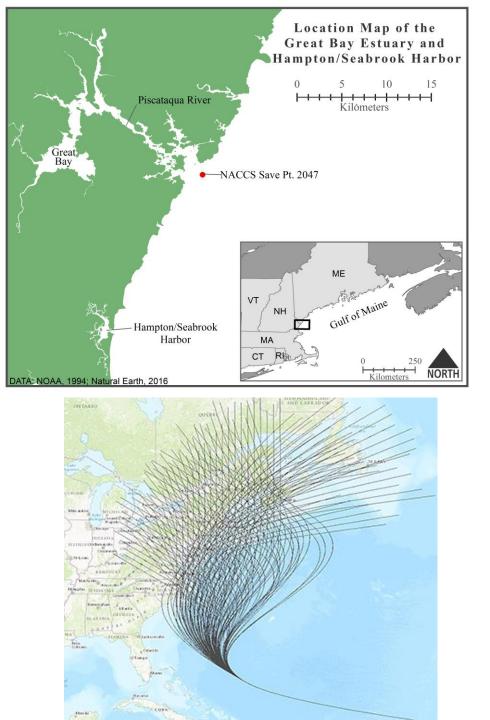

Inundation from Storm Surge (10%, 1%, 0.1% events; NACCS) with and without SLR: 2100 (1.92 m)

Changes to the Max Surface Water Levels & Max currents

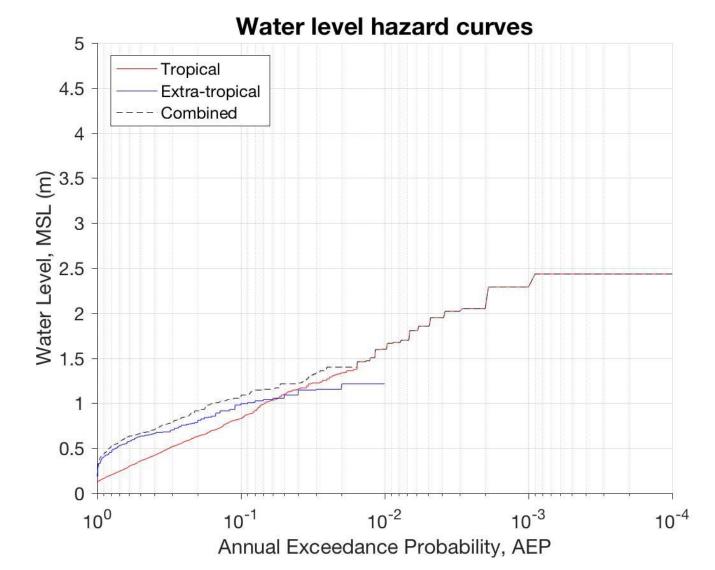

#### - Conclusions

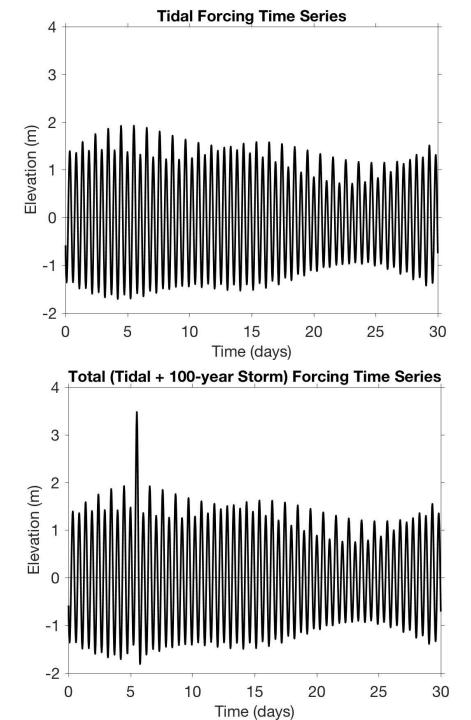

Currents: Increase significantly with Storm surge & SLR

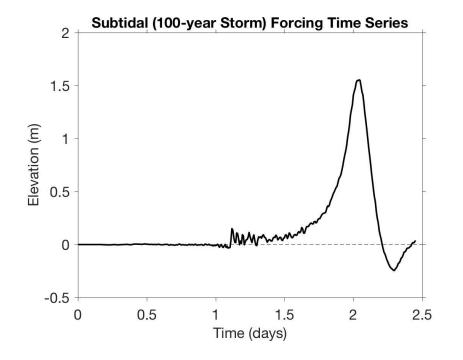

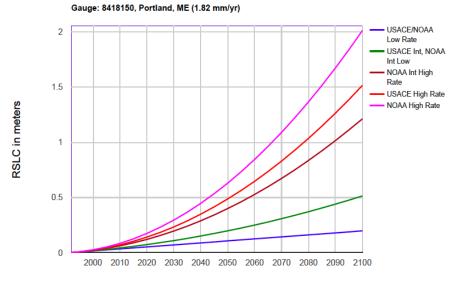

# NACCS Save Pts. in Gulf of Maine Near NH

## Max currents along center channel Great Bay

## Fractional Change in Max currents along center channel Great Bay

			SLR No Surge	No SLR Surge	SLR Surge
<b>Channel Currents</b>	(Fraction Change)				
Flood	Avg	1	1.09	1.31	1.43
	Max	1	1.32	1.52	1.97
Ebb	Avg	1	1.07	1.23	1.32
	Max	1	1.26	1.41	1.61

### **Conclusions/Summary**

Numerical hydrodynamic models have been established for GBE (and HSE) (Presently have not considered ocean waves)

Link to Surge models (NACCS) for Storm Impacts (e.g., 10%, 1%, 0.1% return periods)

Consider SLR as part of the modeling (e.g., 2100 & 2060 NOAA High Scenarios)

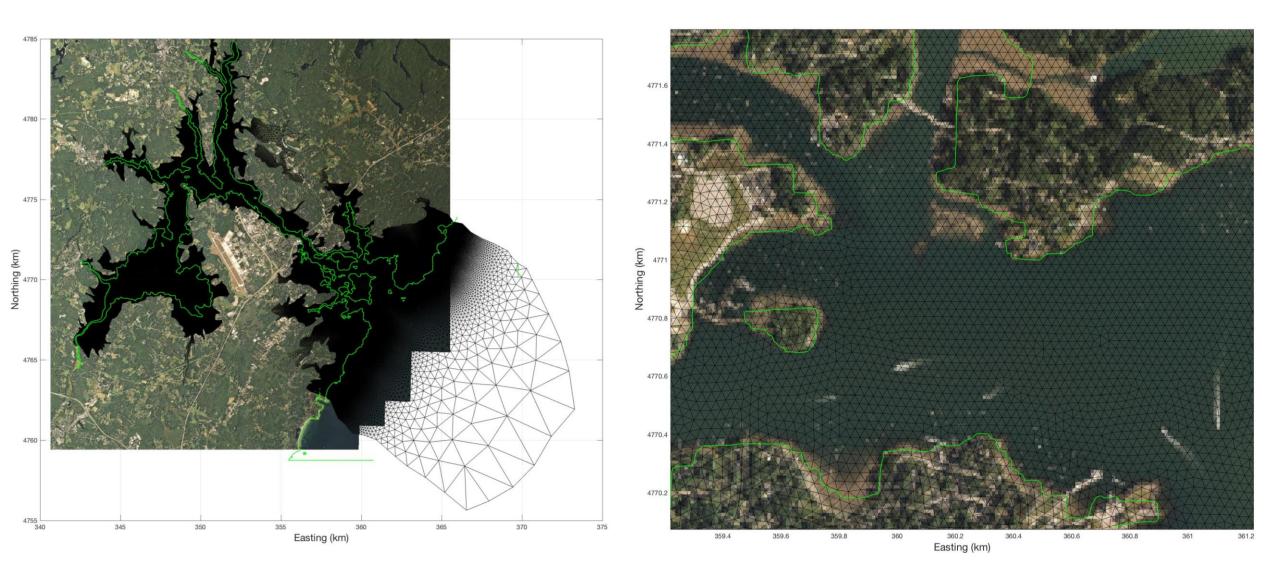

Sync the surge to tidal cycles (e.g., max spring tide, or approximate MHW)

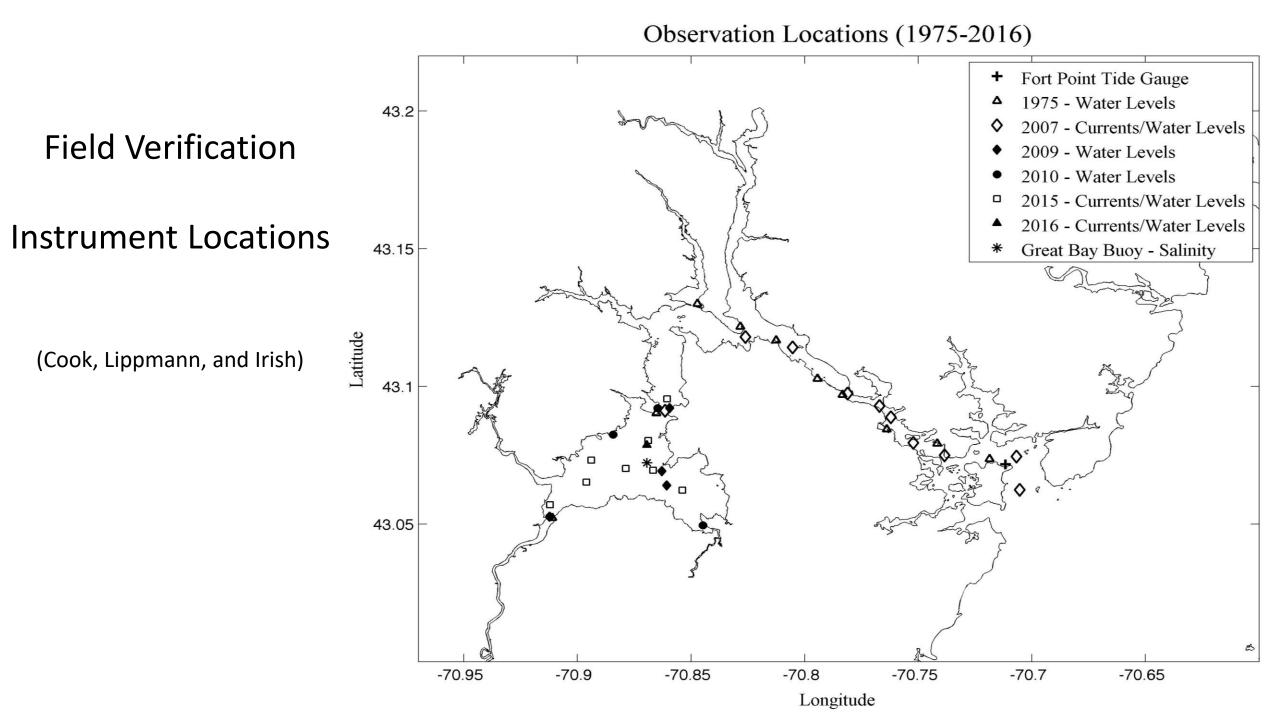

**Estimate**: Inundation, Max. Sea Surface Elevation, Flood Depth/Duration, & Current Velocity Changes

\*Inundation and Flooding for economic impact analysis... \*Currents for navigation, sediment transport, & engineering design...

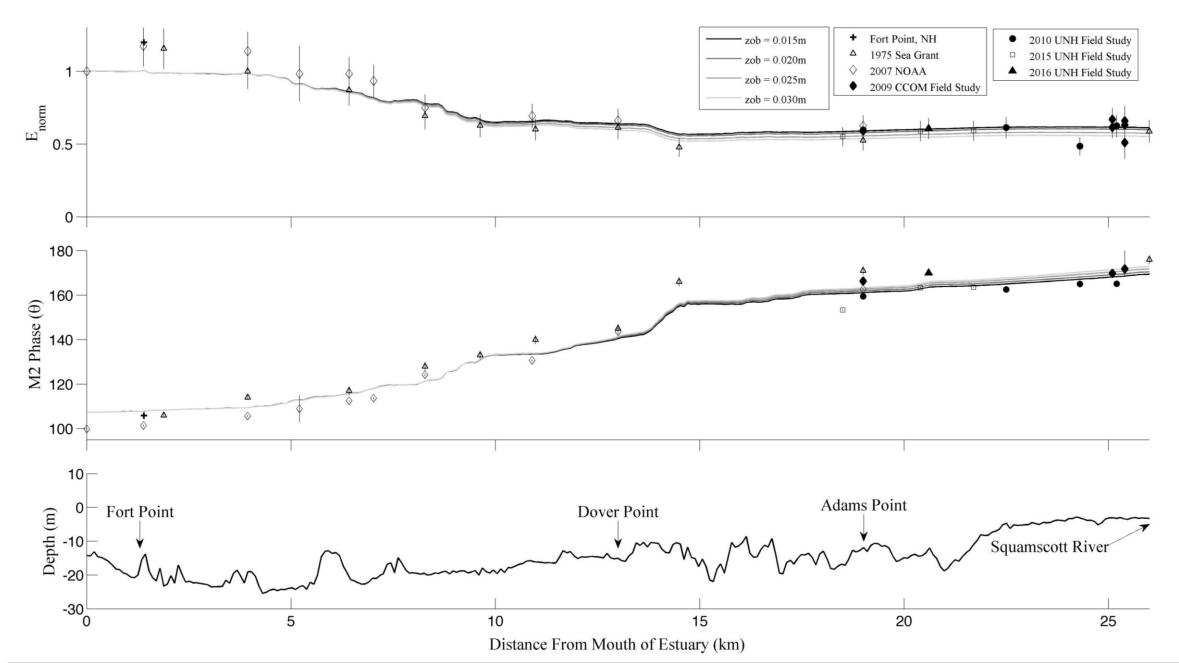

<u>Max Currents</u>: Increases significantly in the Piscataqua River/Great Bay (10-40%); under SLR alone, surge alone, and SLR + Surge. <u>Model Grids</u> Can be rectilinear (or curvilinear), e.g., ROMS or

Unstructured, e.g, FVCOM
